

NEXORA

The financial control layer for autonomous AI agents and USDC applications.

Arc-first · USDC-native · Payment infrastructure analogous to Stripe — for agents, SaaS, games & onchain apps

PARTNER & INVESTOR BRIEFING

nexorafi.app

BUILT WITH CIRCLE · ARC · X402

THE CONTROL GAP

A wallet gives an agent signing authority.
It does not give the operator financial control.

01

Unbounded spend

No per-tx, daily, weekly, or monthly caps once an agent holds keys or a managed wallet.

02

No destination control

Recipients, contracts, and paid services are unconstrained — any signature can drain funds.

03

Missing human gates

High-risk payments need approval queues. Most stacks force all-or-nothing automation.

04

Replay & concurrency

Authorizations can be reused. Concurrent requests can blow past the same limit.

05

No proof of purchase

Operators cannot prove what the agent bought, why, or against which policy.

06

Delivery failures

Payment can succeed while service delivery fails — with no recovery path or receipt trail.

ONE STACK. FULL LIFECYCLE.

Financial control for agents. Payment infrastructure for apps.

Nexora is the financial control layer for autonomous AI agents and USDC applications. It supplies managed wallets, programmable spending rules, x402 payments, paid-service infrastructure, receipts, escrow, notifications, treasury routing, and reconciliation — in one Arc-first stack. Applications keep accounts, entitlements, refunds, tax, and their internal ledger.

CONTROL	COMMERCE	TREASURY	EVIDENCE
Agent wallets Spending policies Approval queues Risk simulation	x402 facilitator Paid API marketplace SDK & middleware Escrow workflows	Save / Earn profiles Arc stablecoin swaps Circle Gateway views Revenue accounting	Public receipts Structured memos Notifications Event indexing

TWO SURFACES. ONE CONTROL LAYER.

Agents spend under policy.
Apps charge with onchain payment rails.

FOR OPERATORS · AGENTS

Autonomous spend control

- ▶ Circle-managed agent wallets (EOA · SCA)
- ▶ Per-tx / daily / weekly / monthly limits
- ▶ Recipient, contract & service allowlists
- ▶ Human approval queues for high-risk pays
- ▶ Normalized receipts, memos, notifications

FOR BUILDERS · APPLICATIONS

Onchain payment infrastructure

- ▶ @nexorafi/x402 SDK + facilitator
- ▶ HTTP 402 paid APIs & metered usage
- ▶ SaaS, games, marketplaces, checkout
- ▶ Escrow, fee split, settlement evidence
- ▶ App owns users, ledger, refunds, tax

WHERE BUILDERS PLUG IN

Programmable USDC payments across product types.

01

SaaS & paid APIs

Return HTTP 402, settle via x402, grant one usage unit, bind receipt to the invoice.

02

Games

Item buys, tournament entries, prize pools, and payouts with fee split and idempotent grants.

03

Marketplaces

Bind purchase to seller, product, fee basis, and receipt — deliver once, payout separately.

04

Subscriptions

Server-owned billing schedule; unique intent per period; retries map to one receipt.

05

Escrow & work

Fund milestones, bonds, deadlines; release only on verified deliverable evidence.

06

Agent treasury

Policy, allowlists, cooldowns, and approvals on every wallet that moves funds.

CLEAN DIVISION OF RESPONSIBILITY

Nexora is payment infrastructure — not a full Stripe replacement.

NEXORA SUPPLIES

- ▶ Payment requirements & x402 facilitation
- ▶ Wallet execution (Circle DCW)
- ▶ Policy checks & approval workflows
- ▶ Fee-aware settlement contracts
- ▶ Normalized receipts & notifications
- ▶ Escrow, Gateway views, treasury routes

APPLICATION OWNS

- ▶ User accounts & authentication
- ▶ Product entitlements & inventory
- ▶ Internal ledger & balances
- ▶ Refunds, disputes & tax
- ▶ Payout authorization rules
- ▶ Exactly-once business delivery

PAYMENT LIFECYCLE

Policy and evidence around every payment.

PLATFORM CAPABILITIES

Wallets, policy, rails, and evidence — one stack.

Agent wallets

Circle Developer-Controlled Wallets (EOA · SCA). Nexora stores identifiers — never private keys.

Policy engine

Per-tx / daily / weekly / monthly caps, allowlists, cooldowns, expiry, required onchain policy.

x402 + SDK

@nexorafi/x402 — paid endpoints for SaaS, games, APIs. Express & Next.js middleware.

Marketplace

Paid APIs via HTTP 402. Reference services + verified independent publishers.

Escrow

USDC work agreements with deadlines, bonds, deliverable evidence, and fee splitting.

Save / Earn

Conservative · Balanced · Growth profiles with risk ceilings and 24h rebalancing.

Receipts & memos

Normalized payment records. Structured Arc memos with public / selective / private scope.

Risk & alerts

Policy simulator, spend thresholds, failed-payment bursts, Telegram / email channels.

DEVELOPER EXPERIENCE

Protect an endpoint. Settle USDC. Return a receipt.

01

Unpaid request

Client hits a paid resource

02

HTTP 402

Payment requirements returned

03

Authorize

Client signs USDC payment

04

Verify · settle

Nexora facilitator settles

05

Deliver

Paid result + receipt

@nexorafi/x402

MIT SDK · Express & Next.js middleware · v1/v2 headers

Facilitator API

verify · settle · /.well-known/x402 · EIP-3009 helpers

Money invariants

Idempotency · one receipt = one business op · server-derived amounts

THREE SETTLEMENT PATHS

One policy layer. Multiple USDC rails.

PAID APIs

Circle Gateway Nanopayments

- ▶ HTTP 402 + payment requirements
- ▶ Payment-signature retry flow
- ▶ Batched settlement evidence
- ▶ Ideal for metered SaaS & agent APIs

ONCHAIN EVENT

Arc ledger settlement

- ▶ Policy enforced in-tx
- ▶ Fee split + reputation update
- ▶ Request replay protection
- ▶ Verified settlement events

DIRECT USDC

EIP-3009 facilitator

- ▶ transferWithAuthorization
- ▶ Nonce + validity window checks
- ▶ Multi-network portable path
- ▶ Receipt only after chain proof

One accounting asset for payments and gas.

ARC

USDC as native gas

Agents operate with one stable unit for application payments and transaction fees. No separate gas-token balance to fund, monitor, or hedge. Sub-second finality and predictable fees make Arc ideal for autonomous payment workflows.

Primary environment for contracts, policy, escrow, Save/Earn, swaps, memos, receipts, and indexing.

CIRCLE STACK

- **Developer-Controlled Wallets**
EOA & SCA agent execution
- **USDC**
Payments, escrow, treasury, gas
- **Gateway + Nanopayments**
Cross-domain balance & 402 APIs
- **x402 batching middleware**
Payment requirement builders
- **Agent Marketplace interfaces**
Policy-wrapped service payments

WHY NOW

Software is becoming an economic actor.

402

HTTP payment standard
for machine commerce

USDC

Stable settlement for agents
and application revenue

1 stack

Wallets + policy + rails
instead of glue code

PRIMARY BUYERS

Agent platforms

Autonomous agents that spend
USDC under operator policy

SaaS & paid APIs

Metered endpoints protected with
x402 / HTTP 402

Games & marketplaces

Purchases, prize pools, creator
commerce, fee splits

Onchain apps

Escrow, subscriptions, treasury, and
receipts

COMPETITIVE POSITIONING

Not another wallet. Not another paywall.
The control plane between them.

CAPABILITY	RAW WALLET	GENERIC 402	NEXORA
Managed agent wallets	—	—	● Circle DCW
Spending policy + approvals	DIY	—	● Full engine
x402 v1 / v2 facilitator	—	Partial	● + SDK
Normalized receipts / memos	—	Minimal	● Scoped
Escrow + Save/Earn treasury	—	—	● Built-in
Replay & concurrency locks	DIY	DIY	● Enforced
Operator notifications	—	—	● Multi-channel

REVENUE ARCHITECTURE

Take rate on agent and application commerce.

01

Marketplace fees

Platform fee on paid-service settlements and publisher volume.

02

Facilitator take

Fee-aware settlement on x402, SaaS usage, and Arc ledger paths.

03

Escrow fees

Split on funded work agreements, games, and release events.

04

Save / Earn

Protocol / platform share on treasury routing activity.

05

Subscriptions

Operator and builder plans for policy, alerts, and analytics.

06

Enterprise

Private deployments, SLA, and custom integration support.

WHAT SHIPS TODAY

Production-shaped. Live on Arc Testnet.

Networks (Arc primary)

SHIPPED SURFACE

- ▶ Agent wallets + operator sessions
- ▶ Policy engine, simulator, approvals
- ▶ x402 facilitator (verify · settle · well-known)
- ▶ Circle Gateway nanopayment services
- ▶ Marketplace + publisher verification
- ▶ Escrow agreements & notifications
- ▶ Save/Earn vault profiles + yield router
- ▶ Arc swaps (USDC ↔ EURC / USYC)
- ▶ Receipts, memos, reputation, indexer
- ▶ Foundry contracts with full test suite

Designed so money movement is constrained and provable.

No key custody

Circle signs agent wallets. Nexora stores identifiers and addresses — not private keys.

Policy before sign

Limits, allowlists, cooldowns, and approvals run before any managed wallet authorization.

Replay resistance

Intent locks, nonce checks, and request identity reduce duplicate spend and concurrent overruns.

Settlement proof

Success is recorded only after valid chain receipt or Gateway payment-response evidence.

Contract hardening

Pause, reentrancy guards, fee ceilings, UUPS checks, restricted roles, two-step ownership.

App security

Wallet-nonce auth, HMAC sessions, SSRF-safe URLs, input limits, secret-gated admin routes.

ARCHITECTURE

Chain is settlement truth. App state is workflow truth.

Operator console

React 19 · policies · agents · marketplace · analytics

Control API

Intents · policies · approvals · receipts · notifications · PostgreSQL

Circle infrastructure

Developer wallets · Gateway · Nanopayments · USDC

Arc contracts

PolicyRegistry · FacilitatorLedger · Escrow · SaveEarn · Settlement

Evidence layer

Indexer · memos · public receipts · reputation · reconciliation

PATH TO SCALE

From Arc Testnet control plane to multi-network standard.

NOW

Prove the loop

- ▶ Arc Testnet product completeness
- ▶ SDK adoption (SaaS, games, APIs)
- ▶ Publisher marketplace density
- ▶ Operator console polish

NEXT

Production harden

- ▶ Mainnet-ready settlement path
- ▶ Deep reorg-safe indexing
- ▶ Enterprise policy packages
- ▶ Expanded Gateway domains

SCALE

Network effects

- ▶ Cross-app intent portability
- ▶ Agent + app reputation economy
- ▶ Treasury products at volume
- ▶ Partner ecosystem & white-label

The financial control layer for autonomous AI agents and USDC applications.

Policy-controlled agent spend. Onchain payment infrastructure for SaaS, games, and apps.
One Arc-first stack for wallets, x402, escrow, receipts, and settlement evidence.
